## connexion ssh

Dans un premier temps il nous faut dupliquer le container template pour créer un nouveau container backup. Pour la duplication d'un container et la modification de ses parametre se référer a Lxc Section duplication. Après avoir dupliquer et configuré le nouveau template il faut se connecter avec la commande

## lxc-attach backup

une fois dans le container il faut générer les clé privée et publique afin de pouvoir se connecté en ssh au autre conteneur, puis nous copierons la clé publique vers les conteneurs vers lesquels nous souhaitons nous connecter. Pour cela nous nous référerons a SSH, nous remplacerons le sio par root.

- 1. aller ds le container cible ⇒ passwd =mdp ⇒ nano /etc/ssh/sshd\_config ⇒ systemctl restart ssh
- 2. retourner sur backup
- 3. ssh root@id

## modif dns

## Script de sauvegarde

```
#!/bin/bash
GREEN="\e[32m"
RED="\e[31m"
